IntelliQE · API Automation

13 features run live against public demo APIs — real results

11 live-verified **2 partial** **0 blocked**

Generated 03 Nov 2026 · backend :3001 · Azure SQL (local)

Scoreboard — what ran, and how

Feature	Capability	Result
API-001	REST gen from OpenAPI / Swagger	LIVE ✓
API-002	GraphQL from SDL / introspection	LIVE ✓
API-003	Contract validation & schema-drift	LIVE ✓
API-004	Service-layer assertions (status / payload / headers / latency)	LIVE ✓
API-005	Chained workflow + variable extraction	LIVE ✓
API-006	OAuth2 / API key / JWT bearer	LIVE ✓
API-007	Load & performance (concurrency)	LIVE ✓
API-008	API self-healing	PARTIAL
API-009	Unified web + API reporting	LIVE ✓
API-010	API test script generation	LIVE ✓
API-011	Environment variable management	LIVE ✓
API-012	Defect auto-push to Jira / ADO	PARTIAL
API-013	Mock server (WireMock / Prism)	LIVE ✓

API-001 REST gen from OpenAPI / Swagger

Target: Swagger Petstore v3 — /api/v3/openapi.json

LIVE ✓

RESULT

- Imported & parsed the OpenAPI 3 spec → 19 runnable endpoints in the catalogue.
- Each endpoint carries method, URL, headers and expected status.

LIVE EVIDENCE

POST /pet — Add a new pet to the store.

Honest note: Full AI test-case generation needs an LLM key (not set in this run); import + parse + analyze ran live.

API-002 GraphQL from SDL / introspection

Target: graphqlzero.almansi.me (introspection) + pasted SDL schema

LIVE ✓

RESULT

- Parsed a GraphQL schema — live introspection and pasted SDL both ran → 1 runnable operation.
- Emitted as a POST carrying the query with a ready selection set.

LIVE EVIDENCE

POST /graphql — Query user by id

API-003 Contract validation & schema-drift

Target: jsonplaceholder.typicode.com/users/1

LIVE ✓

RESULT

- Contract check: 1/1 passed — status 200 ✓, schema valid ✓, 0 violations.
- Drift scan ran against the same live endpoint (no drift adopted).

LIVE EVIDENCE

```
reachable=True, statusOk=True, latency=234ms
```

API-004 Service-layer assertions (status / payload / headers / latency)

Target: httpbin.org/json + jsonplaceholder/posts/1

LIVE ✓

RESULT

- 2/2 endpoints asserted live.
- GET https://httpbin.org/json → 200 in 731ms, schema ✓
- GET https://jsonplaceholder.typicode.com/post… → 200 in 62ms, schema ✓

LIVE EVIDENCE

status + content-type + schema + per-request latency captured

API-005 Chained workflow + variable extraction

Target: jsonplaceholder — GET user → GET that user's post

LIVE ✓

RESULT

- 2 steps, 4/4 assertions passed.
- Extracted uid=1 from step 1's body and chained it into step 2's URL (/posts/1).

LIVE EVIDENCE

```
passed=True, vars={'uid': '1'}, durationMs=132
```

API-006 OAuth2 / API key / JWT bearer

Target: httpbin.org + Duende IdentityServer demo IdP

LIVE ✓

RESULT

- Bearer → httpbin/bearer: 200; API key → httpbin/headers: 200 (X-API-Key echoed).
- OAuth2 client_credentials: fetched a real JWT access token from the demo IdP.

LIVE EVIDENCE

```
JWT: eyJhbGciOiJSUzI1NiIsImtpZCI6IkJBNDA4Njk5QjRFMEFERTZCM...
```

API-007 Load & performance (concurrency)

Target: httpbin.org/get — 40 requests @ 8 concurrent

LIVE ✓

RESULT

- 40 completed, 0 failed, 19.24 req/s over 2079ms.
- Latency p50=233ms p95=727ms p99=731ms avg=348.9ms.

LIVE EVIDENCE

```
statusCounts={'200': 40}
```

API-008 API self-healing

Target: heal/propose — test asserted 201, live now returns 200

PARTIAL

RESULT

- Heal loop ran live: re-observed the endpoint (status 200, reachable True) and returned a decision (shouldHeal=False).
- Classification came back low-confidence 'unknown' with no patch proposed this run.

LIVE EVIDENCE

```
classification=unknown, confidence=low, shouldHeal=False
```

Honest note: The live re-observation ran; richer intent-aware classification/patching needs the System-Config LLM provider fully set up.

API-009 Unified web + API reporting

Target: overview + runs (live DB)

LIVE ✓

RESULT

- One dashboard over 154 runs (40 in 30d), 93% avg pass, 9168 scenarios.
- Runs list carries a source marker — seen: api — Web & API in one list.

LIVE EVIDENCE

```
endpointsCovered=2978, imports=195
```

API-010 API test script generation

Target: codegen/project — target: Playwright

LIVE ✓

RESULT

- Generated a complete, owned project: 7 files.
- Includes: jsonplaceholder-typicode-com.spec.ts, playwright.config.ts, package.json, api…

LIVE EVIDENCE

playwright spec + config + package.json + CI workflow + monitors.yaml

API-011 Environment variable management

Target: environments + resolve (dev/staging/prod)

LIVE ✓

RESULT

- Created env “demo-staging” with baseUrl + variables.
- Resolved {{baseUrl}}/users/{{userId}} → https://jsonplaceholder.typicode.com/users/1

LIVE EVIDENCE

```
vars=[{'key': 'userId', 'secret': False, 'value': '1'}]
```

API-012 Defect auto-push to Jira / ADO

Target: bug-report (live) + Jira/ADO push (needs creds)

PARTIAL

RESULT

- Generated a tracker-ready report live: severity “critical”, labels ['bug', 'api', 'severity:critical', 'server-d….
- Real Jira/ADO WRITE not exercised — no tracker credentials configured in this run.

LIVE EVIDENCE

DefectSync (Jira + Azure) is wired; only the external write is credential-gated.

API-013 Mock server (WireMock / Prism)

Target: wiremock/export · prism/export · wiremock/import

LIVE ✓

RESULT

- WireMock export → 2 stub mappings (exact urlPath + templated urlPathPattern).
- Prism OpenAPI export → paths ['/users', '/users/{id}']. Import → POST /orders back into the catalogue.

LIVE EVIDENCE

NEW connector. Live push to a running WireMock needs a server (verified against a stub); this run exported/imported live.

Method & honest caveats

How these ran

Each feature was driven live through its real backend endpoint under /api/api-automation on the running stack (Express :3001 + Azure SQL in Docker), authenticated as jbsadmin. No results were fabricated.

Targets

Public demo APIs only: Swagger Petstore v3, graphqlzero, jsonplaceholder, httpbin.org, and the Duende IdentityServer demo IdP (real OAuth2 token).

Live-verified (11)

001, 002, 003, 004, 005, 006, 007, 009, 010, 011, 013 returned real data this run.

Partial (2)

008 — the heal loop re-observed the endpoint live but returned low-confidence ‘unknown’ (no patch); full classification needs a configured LLM. 012 — the defect report generated live; the Jira/ADO WRITE is credential-gated and was not exercised.

Caveats

001: OpenAPI import/parse ran live; full AI test-case generation also needs an LLM key. 002: one representative operation emitted. 013: export/import/Prism ran live; live push needs a running WireMock (verified earlier against a stub).
